The following plan is a recommendation for maintaining your Power Breezer and O2 movable unit specifically in hard water locations such as California, Nevada, Utah, and Arizona.

The Power Breezer moveable units are made with LDPE; LDPE has good chemical resistance, high impact strength, and strong wear absorption. Like PET and HDPE plastics, LDPE can hold food products without leaching any harmful materials or allowing microorganisms to permeate.

Cleaning the tank once a week with soap and water will keep the cooling unit operating clean and odor-free.

NOTE: Do not add any chemical(s) to the water because that chemical will be introduced into the air.

Weekly or Prior to Storing for Extended Periods of Time:

- Drain the Water Tank (unscrew the Drain Plug at the lower front of the Water Tank)
- Clean the interior of the Water Tank with mild soap and water.
- Rinse thoroughly.
- Let air dry with the Water Tank Lid off or wipe dry with a towel
- Reseal Drain Plug, add water and operate as needed
- Clean the outside with mild soap and water. Do not use harsh chemicals or abrasives.

Monthly or Quarterly:

NOTE: if you have excessively hard or sandy water, monthly is recommended.

- Drain the Water Tank (unscrew the Drain Plug at the lower front of the Power Breezer)
- If there is white calcium or sand build up on the interior of water tank, scrub with a brush and rinse out
- Let air dry with the Water Tank Lid off or wipe dry with a towel
- Reseal Drain Plug, add water and operate as needed

Semi-Annually:

Remove Water Pump from Water Tank

- D.C. Water Pump (MIV Unit) clean filter
- A.C. Water Pump (M1, MII, MIII) Carefully disassemble the pump
 - Remove outer filter cover on electrical cord side
 - Clean out any debris in the filter

Annually:

- After cleaning and drying the outside, wipe with Armor All.
